Subject: Data management and communication

Jan,

If you are able to be the continuity on the START end of tracking the WQ data and relationship to downstream and treatment system performance that would be helpful. That seems to be a challenge as I have requested consistently that START onsite pay attention to this and alert the OSC as to changes that may indicate an operational problem or need to adjust our treatment.

Secondly, I am looking at the table (Excel) with treatment information and see GK Pond 1 pH values of 15.2 and 21.4, which I assume are Turbidity values. Anne noticed this and is correcting it - in general we need a QA check from you or someone on these tables being posted.

Let me know your thoughts and coordinate with your management as needed.

Thanks
